

## **Phosphate Remover**

- Rapidly removes phosphate and silicate
- Good for fresh or saltwater aquariums
- Keeps fish and invertebrates healthy and active
- Absorbs harmful chemicals, organics, metals, and proteins

## **AquaLife Phosphate Remover**

Aqualife Phosphate Remover is specially formulated to quickly remove phosphate and silicate from saltwater aquariums. Aqualife Phosphate Remover is highly porous for high capacity filtration and bead-shaped for optimum water flow. It outperforms all competing products and performs without restricting flow to quickly remove phosphates that can give rise to excessive algae growth. This product is reef safe.

Phosphates can be introduced into saltwater aquariums in a number of ways. Common aquarium products such as kH buffers and foods can be a source of phosphates. Phosphate levels can quickly get out of hand if not monitored carefully.

Aqualife Phosphate Remover can be used between filter floss, pads, inside filter bags, or in canister filters to remove pollutants that mechanical and chemical filtration leave behind.

Aqualife Phosphate Remover is measurably more effective and lasts longer than competing brands.

Available is 4 convenient sizes: 16oz jar, 16oz and 32oz Easy Pour bottles, and .75 gallons. 16oz treats up to 200 gallons.

Directions: Use 1 cup per 75-100 gallons. Place product in filter bag. Rinse with cold tap water. Product will generate heat when wet the first time. Place for maximum flow through media. Leave product in system for 7 days and test phosphate. If phosphate still reads above 0.02mg/L, replace media.

AquaLife Phosphate Remover is best used in smaller quantities and changed frequently. In an environment with excessively high phosphate readings, it may exhaust rapidly in 6-10 days. Place the product in a high flow rate area and test your phosphate levels. Change as needed.

When aquarium level is are below 0.2 ppm (mg/L), leave that portion of Phosphate Remover in the filter. AquaLife Phosphate Remover may yellow somewhat as it picks up organics, but that is not an indicator of exhaustion of phosphate removal. Continue to test weekly for phosphate. If the phosphate level begins to rise again, add new Phosphate Remover. AquaLife Phosphate Remover absorbs silicates as well. AquaLife Phosphate Remover is inert and is safe to leave in the filter.

Each liter AquaLife Phosphate Remover removes up to 40,000mg of phosphate or about 100 mg/L phosphate in 100 gallons.

After phosphate is at desired levels, change media monthly as needed or when phosphate rises. In reefs or saltwater, use along with trace elements of choice. Discontinue or change trace element type if algae is a problem.

For aquarium use only. Keep out of reach of children.
